

Keep in Step with your Production

Order Tracking System

# The Right Choice

## Value Added

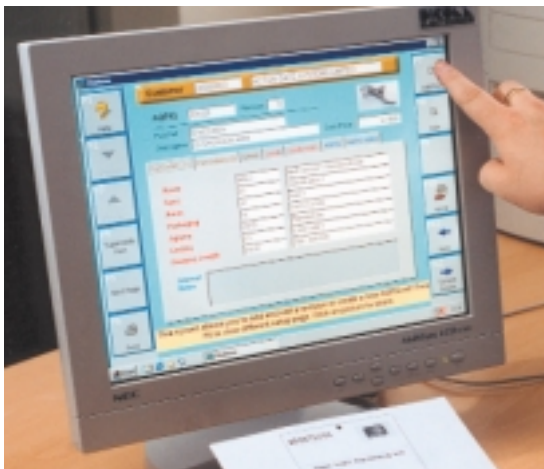

Orpheus has been developed as a production control solution, it is ideally suited to manufacturing or any value added processing operations that must be fast and flexible when competing for business.

It has been designed employing bar code technology, to provide total order tracking and traceability from quotation through to invoicing.

## The Right Look

At the heart of Orpheus is its unique user interface. It has been designed to be intuitive, suited to users at all levels and abilities and as such requires minimal training.

Orpheus is about speed and simplicity. Screen layouts are concise, utilising on-screen assistance, with powerful drill down functionality to get to the information you require.

## Flexible Solution

One of the main benefits of Orpheus is that it enables you to plan for different production methods according to your changing requirements.

Orpheus allows you to manage your production the way you choose and not the way a software system dictates.

Orpheus is configurable to work hand in hand with your accounts; links with Pegasus and Sage accounting systems have been developed.

Orpheus is based on Microsoft database technology, which inherently delivers speed and security. This also opens up the potential for links into internet based solutions.

Where applicable, customers can access their work in progress details via the internet.

## Security

User profiles determine who is allowed to access the system. Access rights are controlled to limit the menus and commands to which a user can gain access.

# Step by Step

## Blueprint

From the moment you first quote, Orpheus is on the case.

A processing blueprint is defined for the job and samples can be produced to prove viability. Production costing details are provided to aid pricing. Visual aids and job specific notes can be added to each process stage.

## Bar Coded

Orpheus gets to work when the job is booked in. Bar coded production route cards are printed for each batch, which details the route and the individual process stages.

As the job progresses through the production route, Orpheus keeps it on track in the correct sequence. Notes can be added to each process to inform the operator of any special requirements.

The operator checks Orpheus for any quality issues. A product photo can be included on the ticket as a simple and very effective visual check.

After production, mandatory quality checks are made and Orpheus produces the paperwork for delivery.

Corrective action procedures are in place to handle rejects.

## Despatch

On delivery the recipient's signature is scanned and held within Orpheus to retain proof of delivery.

At any stage during production, the customer can view work in progress details via the internet.

The goods have been despatched so Orpheus will produce an accurately priced invoice. Orpheus isn't finished yet. It can be configured to integrate directly with your accounting software to maintain ledger transactions.

## Reports

Production reports can be generated, with information available at the touch of a button. Powerful drill down functionality is present to allow easy access to your data, with a complete audit trail of the job history for each process - who, what & when. Reports can be printed or sent directly via email.
